Table SX. Model summaries for intercept-only (main text) models as well as models evaluating influence of habitat, body mass, and continents versus islands. Model estimates ± 95% CIs and test statistics are reported along with sample sizes and residual unexplained heterogeneity (I^2), decomposed by hierarchical model levels (article and observation). The effect size used is given in the heading of each model (SMD=standardized mean difference or Hedges' g; Zr=correlation coefficient; lnOR=log odds ratio).

Term	Estimate	Moderator	Test statistics	Sample size	Residual heterogeneity
Abundance temporal association | All species | Continent vs island | Zr					
island	-0.59 ±[-1.48, 0.29]	Continent vs island	$t_9 = -1.51, p = 0.16$	$N_{articles} = 3$ $N_{species} = 4$ $N_{observations} = 6$	$I^2_{total} = 82.8$ $I^2_{article} = 56.7$ $I^2_{obs} = 26$
mainland	0.3 ±[-0.22, 0.83]	Continent vs island	$t_9 = 1.3, p = 0.22$	$N_{articles} = 8$ $N_{species} = 9$ $N_{observations} = 13$	$I^2_{total} = 82.8$ $I^2_{article} = 56.7$ $I^2_{obs} = 26$
Abundance on islands with/without cats | All species | Ground foraging | lnOR					
ground	0.07 ±[-2.04, 2.17]	Ground foraging	$t_9 = 0.07, p = 0.94$	$N_{articles} = 4$ $N_{species} = 4$ $N_{observations} = 4$	$I^2_{total} = 43.4$ $I^2_{article} = 43.4$ $I^2_{obs} = 0$
