

Table S7. Model summaries of models filtered to only include the dominant effect size type (e.g., Zr, SMD or lnOR) without converted effect sizes. Model estimates $\pm$ 95% CIs and test statistics are reported along with sample sizes and residual unexplained heterogeneity (I^2), decomposed by hierarchical model structure (article and observation). The effect size used is given in the heading of each model (SMD=standardized mean difference or Hedges' g; Zr=correlation coefficient; lnOR=log odds ratio).
